product description: wellboard gamma

good design with a touch of individuality!

wellboard - the corrugated material - points a new way to the future for shop fittings, trade fair construction and furniture. with its special design and versatility the material is a delight to work with.

with wellboard gamma, well gmbh is pleased to introduce a new product line!

wellboard gamma is a natural product, as are all the other types of wellboard - minimum, medium and maximum. it is made from 100% pressed cellulose, and because it is solid but flexible it means that it is ideal for making both perfect curves and edges.

wellboard can be treated and used in the same way as wood, meaning that it can be glued to other materials and coloured with various coatings and varnishes. with a weight of 1.2 - 2.7 kg/m² it has the benefit of being remarkably lightweight.

the profile of wellboard gamma distinguishes it from other similar materials. the flatter edge to the curves give an overall impression of smoothness, providing the perfect complement to the more rounded curves of wellboard alpha.

this design means that the material has an even surface, making it easier to glue or screw to other materials, as well as attaching any fittings or mountings.

wellboard gamma is available in a choice of two profiles. the width is 200 cm and the length is 530/550 cm. the material is delivered in rolls packed in handy cardboard tubes.
